

Robocopy Drop 1.6.0

Quick guide - Robocopy transfers and GitHub updates

Main workflow

- In File Explorer, select one or more files or folders.
- Right-drag them to the destination folder.
- Choose **Copy here via Robocopy**.
- Use the progress window to monitor source, destination, speed, estimated time, and remaining files.

Threads and automatic profile

The **Automatic (adaptive)** profile uses 32 threads on local drives and lowers concurrency for USB/removable devices, network destinations, and optical media. Settings also offers manual 1, 4, 8, 16, 32, or 64-thread modes.

Conflicts and verification

- For existing files, choose Replace, Skip, or Keep both.
- After the transfer, open the destination, copy the summary, or save the report.
- SHA-256 verification rereads source and destination and confirms byte-for-byte equality.

Settings and closing

Save applies the language, thread mode, and update preference. **Cancel**, Escape, and the close button exit without saving.

GitHub updates

When configured for the official repository, Robocopy Drop checks at most once every 24 hours for a newer stable release. There is no resident agent, and an active copy or verification is never interrupted.

- Use **Check for Robocopy Drop Updates** from Start, or the button in Settings, for a manual check.
- A download starts only after user confirmation.
- The updater validates the expected asset name, HTTPS, size, and the SHA-256 digest published by GitHub.
- Authenticode is verified and can be required by public release builds.
- After verification, Windows Installer starts in assisted mode without forcing a reboot.

Privacy

Robocopy Drop has no telemetry. Update checks only send an HTTPS request to the public GitHub Releases API. File names, paths, reports, and transfer statistics are not transmitted.

Uninstall

Use the separate **Uninstall Robocopy Drop** Start-menu entry. It launches Windows Installer directly and shows the normal removal confirmation.

Security notes

For public distribution, use Authenticode-signed packages and install updates only from the official release. The project is MIT licensed; WiX is used only as a build tool.
